

Quiz

1. Which of the following data types is NOT explicitly mentioned as a core concept in the Python tutorial?

- A. Strings
- B. Integers
- C. Booleans
- D. Floats

Answer: D

Explanation: While the tutorial likely covers floats, the summary explicitly mentions strings, integers, and booleans as core data types.

2. What is the primary purpose of 'if' statements in Python?

- A. To repeat a block of code multiple times.
- B. To define reusable blocks of code.
- C. To allow programs to make decisions based on conditions.
- D. To create custom data types.
- E. To read from files.

Answer: C

Explanation: If statements are conditional statements that execute different blocks of code based on whether a specified condition is true or false.

3. What is the purpose of modules in Python?

- A. To define the structure of objects.
- B. To create loops that repeat code.
- C. To provide access to pre-built code (functions, variables).
- D. To manage and install external Python libraries.
- E. To handle writing to files.

Answer: C

Explanation: Modules provide a way to organize and reuse code. They contain functions, variables, and classes that can be imported into other programs.

4. What does the term 'inheritance' refer to in the context of Python classes?

- A. Creating instances of a class.
- B. Defining the attributes and methods of a class.
- C. A class inheriting the functionalities of another class.
- D. Managing external Python libraries.
- E. Defining the return of a method.

Answer: C

Explanation: Inheritance allows a class (the child class) to inherit attributes and methods from another class (the parent class), promoting code reuse and organization.

5. What is the role of PIP in Python development?

- A. It's a built-in Python module for file handling.
- B. It's a tool for defining classes and objects.
- C. It's a package manager for installing and managing external Python libraries.
- D. It's a type of loop used for iterating over collections.
- E. It's a built-in method for making conditional statements.

Answer: C

Explanation: PIP (Pip Installs Packages) is a package management system used to install and manage software packages written in Python.
